About Dana-Farber Cancer Institute

For more than 60 years, Dana-Farber Cancer Institute has had one goal: to reduce the suffering caused by cancer through advanced clinical care and cutting-edge scientific research. As a principal teaching affiliate of Harvard Medical School, we are able to attract many of the best and brightest physicians in the world to pursue this mission.

At Dana-Farber, we are committed to a multidisciplinary, compassionate, and collaborative model of care that puts patients and their families at the center of all we do. We work in teams organized around combating specific types of cancer, and patients have easy and direct access to the full range of specialists they may need.

Our scientific research is focused on understanding the biology of cancer cells in order to develop more effective therapies that improve patient outcomes. Our lab scientists and clinicians collaborate closely to quickly translate findings from the lab into therapies that can be delivered to patients in our clinics and disseminated throughout the world.

Dana-Farber is a founding member of Dana-Farber/Harvard Cancer Center (DF/HCC), an NCI-designated Comprehensive Cancer Center. DF/HCC harnesses the expertise and resources of Dana-Farber and six other Harvard-affiliated hospitals and research institutions to conduct research focused on improving the understanding and treatment of cancer. Dana-Farber is also a founding member of the National Comprehensive Cancer Network, an alliance of the world’s leading cancer centers, working together to develop cancer treatment guidelines and conduct research that improves the quality and effectiveness of cancer care. In addition, Dana-Farber has earned “Magnet” status, recognizing the Institute’s high-quality patient care, nursing excellence, and innovations in professional nursing practice.
Gastrointestinal Cancer

The Gastrointestinal Cancer Center provides advanced, integrated care for patients diagnosed with or at risk for colorectal, pancreatic, stomach, liver, gallbladder, bile duct, and esophageal cancers, as well as neuroendocrine and carcinoid tumors. Patients are cared for by a multidisciplinary team of specialists who use advanced, innovative techniques to diagnose and treat gastrointestinal malignancies.

Our team is a leader in delivering a personalized treatment approach for many gastrointestinal malignancies. All colorectal cancers are tested for KRAS and BRAF mutations, with therapy tailored according to the tumor genotype. In addition, treatment for patients with esophageal and gastric cancers is provided based on each patient’s individual HER2 amplification.

The Center offers genetic counseling and testing to patients with a family history of gastrointestinal cancers. This program also conducts research to understand the genetic causes of cancer and to evaluate new diagnostic tests for early detection, novel endoscopic techniques, and new medical therapies to prevent gastrointestinal cancers.

The clinical investigators in the Center conduct basic and translational research to develop more effective treatment techniques for patients with gastrointestinal cancers, and understand the biology of gastrointestinal malignancies.
